## About this book

This publication, "Guide to Eating Ontario Sport Fish," is intended to provide the angler and consumer with the most up-to-date advice on recommended levels of consumption of game or sport fish from over 1,300 of Ontario's lakes, rivers and locations on the Great Lakes.

This annually-revised, bilingual publication is unique in North America in its scope, detail and coverage of the facts regarding fish and potentially contaminating chemicals. It is the product of dedicated work by many technicians, analysts, scientists and medical specialists of the Ontario ministries of Environment, Natural Resources and Labour.

## Avant-propos

La présente publication, "Guide pour la consommation du poisson gibier de l'Ontario", vise à donner au pêcheur à la ligne et au consommateur les conseils les plus à jour quant aux niveaux recommandés de consommation des poissons de pêche sportive de plus de 1 300 lacs, rivières et lieux de pêche des Grands Lacs de l'Ontario.

Cette publication bilingue, révisée chaque année, est sans égale en Amérique du Nord par l'ampleur, le degré de détail et l'étendue du champ couvert en ce qui concerne les poissons et les substances chimiques susceptibles de les contaminer. Elle est le fruit du labeur et du dévouement de nombreux techniciens, analystes, chercheurs et médecins spécialistes au services des ministères ontariens de l'Environnement, des Richesses naturelles et du Travail.

## Ontario's Fish Contaminant Monitoring Program

### Introduction

Ontario has always been renowned for its excellent fishing. With over 250,000 lakes and uncounted rivers, and bordering on four of the Great Lakes, this Province has been blessed with as great and varied an angling potential as almost anywhere else in the world.

In the late 1960's and early 1970's, however, that image of an unspoiled environment and silvery, fighting fish became tarnished by a single word—pollution. Authors such as the late Rachel Carson (*Silent Spring*), Barry Commoner (*Science and Survival*) (*The Closing Circle*), Ralph Brinkhurst and Donald Chant (*This Good, Good Earth: Our Fight For Survival*), John Livingston (*One Cosmic Instant*)—all wrote that man's pursuit of economic progress without regard for the protection and preservation of the natural environment would pollute, perhaps irrevocably, our finest fishing waters.

Specific cases of pollution of certain lakes and river systems did occur, and by the mid 1970's, there was a question in the minds of many people as to whether or not all lakes and rivers contained fish that were unfit to eat. As a result, the Province of Ontario undertook to develop a fish testing and information program to provide accurate up-to-date advice on safe levels of consumption of fish from locations throughout Ontario.

In April, 1978, the first edition of the "Guide to Eating Ontario Sport Fish" book was published. Since then, annually-updated editions of these free publications have appeared each spring. This 1985 edition contains the best available information on the significance of contaminants tested for in over 85,000 fish from nearly 1,300 locations in the

## Le programme ontarien de surveillance des polluants contaminant le poisson

### Introduction

L'Ontario a toujours été renommé pour l'excellence de sa pêche. Avec plus de 250 000 lacs, d'innombrables rivières et des étendues de côtes sur quatre des Grands Lacs, la province est dotée d'un potentiel de pêche à la ligne dont la superficie et la variété n'ont guère d'égal où que ce soit dans le monde.

Mais vers la fin des années 1960 et le début des années 1970, cette image d'une nature intacte, le scintillement argenté du poisson dont on vient finalement à bout commencent à se ternir sous l'effet d'un mot: pollution. Des auteurs comme Rachel Carson (*Printemps silencieux*), Barry Commoner (*Quelle terre laisserons-nous à nos enfants?*), (*L'encercllement*), Ralph Brinkhurst et Donald Chant (*This Good, Good Earth: Our Fight for Survival*), John Livingston (*One Cosmic Instant*) ont tous expliqué que si l'homme s'acharnait à poursuivre le progrès économique sans égard pour la protection et la préservation du milieu naturel, il polluerait, irrévocablement peut-être, nos plus belles eaux de pêche.

Des cas de pollution de certains lacs et bassins hydrographiques se produisirent en effet, et vers le milieu des années 1970, bien des gens se demandaient si les lacs et les rivières ne contenaient pas tous des poissons impropres à la consommation. C'est pourquoi la province de l'Ontario entreprit de mettre en place un programme d'analyse des poissons et d'information qui viserait à fournir des conseils exacts et à jour sur les seuils de sécurité pour la consommation du poissons pêchés à divers emplacements dans toutes les parties de l'Ontario.

La première édition du "Guide pour la consommation du poisson gibier de l'Ontario" a paru en avril 1978, et depuis lors une édition revue et mise à jour de cette publication gratuite paraît chaque année au printemps. L'édition de 1985 contient les meilleurs renseignements disponibles sur les contaminants, qui ont fait l'objet d'analyses effectuées sur plus de 85 000 poissons prélevés à plus de 1 300 emplacements de la province. Il ressort des résultats

Province. These results indicate that several of the pollutants which raised such concerns among environmentalists 10 or 15 years ago have, through pollution control efforts during that period, declined in level and significance in sport fish. Examples of this are mercury in fish from Lake St. Clair and the English-Wabigoon river system in Northwestern Ontario, DDT levels in fish from many waters, including the Great Lakes, mirex levels in certain Lake Ontario fish, and PCB (polychlorinated biphenyl) levels in some Great Lakes fish species. These welcome signs of declining pollution, and therefore a more usable sport fishery, indicate most clearly that many pollutants can be controlled and that, with time, the environment can recover. The results in this book (and in previous editions) indicate that many Ontario waterbodies and fish from them have never been polluted or contaminated by toxic chemicals. And while this is welcome information, it points out that preservation of this heritage requires diligent effort on the part of government and industries as well as the support of conservation-minded anglers and citizens to prevent pollution and ensure that our descendants will be able not only to enjoy catching fish from Ontario's waters but also eating them.

de ces analyses que plusieurs des polluants qui inquiétaient tant les écologistes il y a 10 ou 15 ans ne sont plus, grâce aux efforts de dépollution déployés durant cette période, ni aussi abondants ni aussi préoccupants qu'auparavant dans le poisson gibier. C'est le cas par exemple du mercure, pour les poissons du lac St. Clair et du bassin des rivières English et Wabigoon dans le Nord-Ouest de l'Ontario, du DDT pour des poissons de nombre d'étendues d'eau, y compris les Grands Lacs, de la concentration de mirex dans certains poissons du lac Ontario et des PCB (biphényles polychlorés) pour certaines espèces des Grands Lacs. Ces indications d'un recul de la pollution, et par conséquent d'un regain des possibilités de pêche sportive, non seulement sont bienvenues en soi, mais indiquent clairement que nombre de polluants peuvent être combattus, et qu'avec le temps l'environnement peut guérir. Des conclusions de la présente brochure et des éditions précédentes font apparaître que nombre d'étendues d'eau et de poissons de l'Ontario n'ont jamais été pollués ou contaminés par des substances chimiques toxiques. C'est là une bonne nouvelle, mais il en ressort aussi que la préservation de ce patrimoine exige des efforts diligents de la part des pouvoirs publics et des industries, ainsi que l'appui des pêcheurs et des citoyens conscients de la nécessité de protéger l'environnement, afin de prévenir la pollution et de faire en sorte que nos descendants puissent non seulement avoir le plaisir de pêcher le poisson des eaux ontariennes, mais aussi celui de le manger.

## The Evolution of the Program

The Ontario government began monitoring DDT levels in fish in the mid-1960's when concerns were first raised about the aquatic effects of that insecticide. During 1969 and the early 1970's, intensive sampling for mercury in fish was undertaken in the English-Wabigoon River system in northwestern Ontario and the St. Clair River — Lake St. Clair system in southwestern Ontario. Both these systems were affected by mercury discharges from chlor-alkali plants which produced chlorine and caustic soda for industrial purposes. As the result of action by government and industry, loss of mercury to the aquatic environment was curtailed from this process. Between 1970 and 1976, studies of mercury, pesticides and organic chemicals such as PCB in fish were undertaken in the vicinity of other industries, mining sites, areas of natural mineral deposits, commercial fishing areas, and lakes used as a source of food supply by Ontario's native peoples. Samples from some popular angling waters were analyzed as well.

By 1976, it was decided that the accumulated data were not only useful to scientists and pollution control engineers for scientific monitoring and research but, if health-related guidelines for the safe consumption of fish were also available, these data could be used to answer the many public enquiries about the state of the aquatic environment and the safety of consuming fish from particular lakes.

## Évolution du programme

Le gouvernement de l'Ontario a commencé de surveiller les concentrations de DDT dans le poisson vers le milieu des années 1960, lorsque les premières inquiétudes se sont manifestées quant aux effets de cet insecticide en milieu aquatique. En 1969 et au début des années 1970, un programme intensif de prélèvements de poissons pour contrôle des concentrations de mercure a été entrepris dans le bassin hydrographique de l'English et de la Wabigoon dans le Nord-Ouest de l'Ontario, et dans le bassin de la rivière St. Clair et du lac St. Clair dans le Sud-Ouest de la province. Ces deux bassins étaient atteints par les rejets de mercure des usines de production de chlore et de soude caustique à usage industriel. Les mesures prises par les pouvoirs publics et par l'industrie ont abouti à une réduction des rejets de mercure en milieu aquatique résultant de cette production. Entre 1970 et 1976, des études sur les concentrations de mercure, de pesticides et de substances chimiques organiques comme les PCB dans le poisson ont été entreprises au voisinage d'autres entreprises industrielles, chantiers de mines, zones de gisements naturels de minéraux, zones de pêche commerciale et lacs utilisés par les autochtones de l'Ontario comme source d'aliments. Des prélèvements ont également été effectués dans certaines eaux fréquentées des pêcheurs et ont fait l'objet d'analyses.

En 1976, il a été décidé que les données ainsi rassemblées non seulement étaient utiles aux chercheurs et aux techniciens de la lutte antipollution pour leur programme de surveillance et de recherche scientifique, mais encore qu'elles fourniraient, si elles étaient accompagnées d'un guide sur les précautions à prendre du point de vue de la santé, dans la consommation de poisson, la réponse à bien des questions que se posait

Accordingly, a program was initiated to assess all statistically reliable fish contaminant data and publish them in a widely available public format. At the same time, a program to test as many popular angling waters as possible was initiated.

The Fish Contaminant Monitoring Program operates as a co-ordinated undertaking of the Ontario ministries of Environment, Natural Resources, and Labour.

Fish are collected primarily by staff of the Ministry of Natural Resources. Scientists from the Ministry of the Environment analyze the fish samples for various contaminants and assess the findings in relation to the health significance of each contaminant provided by medical specialists in the Ministry of Labour. The information is then published in the "Guide to Eating Ontario Sport Fish". Depending on when particular sets of analyses become available, they will normally be publically released first in the MOE Environmental Health Bulletin and subsequently in the next Guide book.

As well as the Sport Fish Testing Program in Ontario, the Ministry of the Environment has extensive programs of testing forage fish, surface and ground water, and aquatic sediments for contaminants to identify pollutant sources and determine trends. Analyses are made of raw and treated drinking waters from many locations to ensure the protection of public health.

The Government of Canada through Fisheries and Oceans Canada carries out contaminant testing of fish caught by commercial fishermen for sale to the public or for shipment outside Ontario.

le public quant à la condition du milieu aquatique et à la possibilité de manger sans danger du poisson de tel ou tel lac.

C'est alors que fut mis en train un programme d'évaluation de toutes les données statistiquement valables sur les polluants contaminant le poisson en vue de les regrouper dans une publication qui serait largement diffusée. En même temps était mis sur pied un programme d'analyses qui porteraient sur autant de zones populaires de pêche que possible.

Le Programme de surveillance des polluants contaminant le poisson est une entreprise conjointe et coordonnée des ministères ontariens de l'Environnement, des Richesses naturelles et du Travail.

Les poissons sont principalement prélevés par le personnel du ministère des Richesses naturelles. Les chercheurs du ministère de l'Environnement analysent les échantillons de poisson pour déterminer la présence de divers polluants et évaluent les résultats eu égard aux renseignements que leur fournissent les médecins spécialistes du ministère du Travail sur l'incidence de chaque polluant sur la santé. L'information est ensuite publiée dans le "Guide pour la consommation du poisson gibier de l'Ontario". Selon la date à laquelle sont connus les résultats des différentes séries d'analyses, ceux-ci seront normalement diffusés d'abord dans le Bulletin sur la sécurité de l'environnement du ministère de l'Environnement, puis dans la prochaine édition du guide.

Outre le Programme d'analyse du poisson gibier de l'Ontario, le ministère de l'Environnement conduit des programmes étendus d'analyses sur les poissons destinés à l'alimentation animale, sur les eaux de surface et les eaux souterraines, et sur les sédiments aquatiques pour évaluer leur contenu en substances contaminantes et identifier ainsi les sources de polluants et déterminer les courbes d'évolution. Des échantillons d'eaux de boisson, tant brutes

## Selection of Lakes for Testing

With over 250,000 lakes, uncounted rivers and streams and the many local areas in the Great Lakes, it would not be practical or economical to carry out testing on each and every water body. Over 1,300 locations have been tested in the past eight years. Selection of waterbodies to be tested is an on-going process and public input is welcomed so that information will be available to answer public concerns. Citizens who wish to have fish tested from a lake or river which does not appear in the Guide are invited to write to their local office of the Ministry of Natural Resources or Environment with their specific request. The lakes to be tested are selected by staff of the Ministry of the Environment and Natural Resources for one or more of the following reasons:

- a popular angling area
- a known or suspected source of pollution is nearby
- a major source of food for local inhabitants (usually lakes in the vicinity of Indian Reserves)
- a commercial fishery
- lakes being opened for recreational development
- monitoring program for long-term studies of contaminants in fish.

que traitées, prélevées en maints endroits sont analysés pour la protection de la santé publique.

Le gouvernement du Canada, par le truchement de Pêches et Océans Canada, procède à des contrôles de la présence de contaminants dans le poisson pris par les pêcheurs commerciaux pour vente au public ou pour expédition en dehors de l'Ontario.

## Choix des lacs à étudier

Étant donné qu'il y a en Ontario plus de 250 000 lacs, d'innombrables rivières et cours d'eau et quantité d'emplacements de pêche sur les Grands Lacs, il ne serait ni pratique ni économique de chercher à soumettre à des analyses toutes les masses d'eau sans exception. Plus de 1 300 emplacements ont été étudiés au cours des huit dernières années. Le choix des masses d'eau à étudier est un processus continu, et le public est invité à y participer afin que des renseignements puissent être fournis qui répondent aux questions que le public se pose. Les citoyens qui voudraient faire étudier des poissons d'un lac ou d'une rivière qui ne figure pas dans le Guide sont invités à écrire au bureau local du ministère des Richesses naturelles ou du ministère de l'Environnement en fournissant tous les détails voulus sur l'objet de leur demande. Les lacs à étudier sont choisis par le personnel du ministère de l'Environnement et des Richesses naturelles pour une ou plusieurs des raisons suivantes:

- C'est une zone de pêche populaire
- Il existe à proximité une source connue ou supposée de pollution
- C'est une source importante de nourriture pour les habitants du lieu (cas, généralement, des lacs voisins de réserves indiennes)
- C'est un lieu de pêche commerciale
- Il s'agit de lacs sur le point d'être ouverts à l'exploitation pour activités de loisirs
- Ils figurent au programme d'étude à long terme des polluants contaminant le poisson.

## Selection of Fish Species for Testing

Most lakes and rivers contain a variety of fish species. When selecting appropriate species for contaminant testing it should be noted that not all species accumulate a particular contaminant at the same rate. Therefore, one kind of fish at a certain size may have a much lower contaminant concentration than another species of the same size. This is due, in part, to the fact that different fish feed on different things, have a variety of habitats, grow at different rates and are physiologically different.

For example, fish such as walleye (yellow pickerel) and northern pike are likely to contain higher levels of mercury than a species such as whitefish at the same size since walleye and pike are "top predators" feeding on smaller fish which also may contain elevated mercury levels. The whitefish, on the other hand, feeds lower down the "food chain" on aquatic insects and invertebrates which contain less mercury than small fish. It is, therefore, a practice when testing fish in specific areas for mercury, to test those species in a lake which are "top predators" as they will indicate the highest mercury levels. If low levels are found in predators, testing of other species may not be required.

In testing for organic contaminants such as PCB (an industrial lubricant and insulating fluid now strictly controlled) and mirex (a fire-retardant additive and pesticide that is no longer used), it is most appropriate to test species of fish such as salmon, lake trout, smelt and perch with high fat levels in the flesh. Organic contaminants usually tend to accumulate in fatty tissue.

## Choix des espèces de poisson à analyser

La plupart des lacs et cours d'eau contiennent diverses espèces de poissons. Lorsqu'il s'agit de choisir les espèces voulues pour contrôler la présence de polluants, il convient de noter que toutes les espèces n'accumulent pas un polluant donné au même taux. Il en résulte qu'à taille égale, un poisson d'une certaine espèce aura une concentration de polluant beaucoup plus basse qu'un poisson d'une autre espèce. Cela tient d'une part au fait que les poissons se nourrissent différemment, ont des habitats différents, grandissent à un rythme différent et sont physiologiquement différents les uns des autres.

C'est ainsi que des poissons comme le doré et le brochet contiendront probablement des concentrations de mercure plus élevées, à taille égale, qu'une espèce comme la grande corégone, du fait que le doré et le brochet, à l'extrémité de la chaîne alimentaire, sont des gros carnivores qui se nourrissent de poissons plus petits susceptibles de contenir eux aussi des concentrations élevées de mercure, tandis que la corégone se nourrit, à un niveau plus bas de la chaîne alimentaire, d'insectes et d'invertébrés aquatiques qui contiennent moins de mercure que les petits poissons. La pratique est donc, quand on étudie les poissons d'une aire donnée pour déterminer la présence de mercure, de choisir à cette fin, dans la population du lac, les gros carnivores, car c'est chez eux qu'apparaîtront les concentrations de mercure les plus élevées. Si les carnivores révèlent de basses concentrations, il n'y aura peut-être pas lieu de faire d'analyses sur d'autres espèces.

Lorsqu'on cherche à déterminer la présence de contaminants organiques comme les PCB (fluides industriels lubrifiants et isolants actuellement soumis à des contraintes strictes) et le mirex (additif ignifuge et pesticide qui n'est plus utilisé), il convient particulièrement d'étudier des poissons comme le saumon, la truite de lac, l'éperlan et la perchaude, espèces à chair très grasse, étant donné que les contaminants organiques tendent d'ordinaire à se concentrer dans les tissus adipeux.

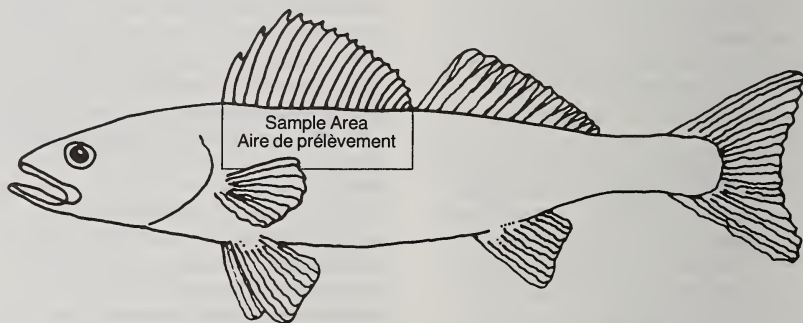

### Collection of Fish for Testing

Most fish are collected by staff of the Ministry of Natural Resources using various netting methods. In some cases, fish are sampled from a commercial fisherman's catch.

Whenever possible, the collection includes 15 to 20 fish of each species with lengths and weights representative of the size range of that species from the lake being tested. The length, weight and sex of each fish collected are recorded. In some cases, scale samples are taken so that the age of the fish can be determined. A boneless, skinless fillet of dorsal muscle flesh is removed from the fish (see illustration), packaged and frozen for shipment to the Ministry of the Environment laboratories in Toronto.

### Prélèvement des poissons à analyser

La plupart des poissons sont prélevés par le personnel du ministère des Richesses naturelles, qui les prend au filet de diverses façons. Parfois, les poissons sont prélevés sur les prises de pêcheurs marchands. Autant que possible, le prélèvement comprend de 15 à 20 poissons de chaque espèce, dont la longueur et le poids sont représentatifs de la gamme de tailles de cette espèce pour le lac qu'il s'agit d'étudier. On prend note de la longueur, du poids et du sexe de chaque poisson prélevé. Dans certains cas, on prend des échantillons d'écaillés pour pouvoir déterminer l'âge du poisson. Un filet sans arêtes ni peau est prélevé (voir illustration), emballé et surgelé pour expédition aux laboratoires du ministère de l'Environnement à Toronto.

## Testing of Fish

Experience with the testing of fish samples over the past 15 years has shown that a boneless, skinless dorsal fillet sample provides more consistent results than other tissue types. This portion of the fillet also represents the choicest edible part of most sport fish. *Where contamination by organic substances such as PCB or mirex is confirmed, it is recommended that only the boneless, skinless dorsal fillet be consumed.*

Analysis of fish tissue for contaminants at the laboratories of the Ministry of the Environment is done by a variety of methods depending on the particular contaminants of interest. Mercury testing is done by automated flameless atomic absorption spectrophotometry. Organics such as PCB, mirex and organochlorine pesticides (DDT, aldrin, chlordane, etc.) are measured by gas chromatography. Special analysis for 2,3,7,8-TCDD (dioxin) at levels of a few parts per trillion is done by combined gas chromatograph-mass spectrometer technique.

Depending on the method used, the cost of each analysis can range from a few dollars (for mercury) to several hundred dollars (for 2,3,7,8-TCDD) for each analysis.

After analysis, the results, together with the physical information collected on each fish are used to develop the tables outlining size-specific consumption advice for each species from each waterbody. Contaminant values for each size of fish are calculated and these are compared with medical advice on the significance of a contaminant to human health as reflected in the appropriate Canadian government health protection guidelines.

After data from the laboratories have been

## Analyse des poissons

On a appris à l'expérience au cours des 15 dernières années que de tous les échantillons de poissons, c'est un filet de muscle dorsal sans arêtes ni peau qui donne les résultats les plus cohérents. Cette partie du filet représente aussi la partie comestible la plus recherchée dans la plupart des poissons de pêche sportive. *Lorsqu'il se confirme qu'il y a contamination par des substances organiques comme les PCB ou le mirex, il est recommandé de ne consommer que le filet dorsal sans peau ni arêtes.*

L'analyse du tissu de poisson pour déterminer la présence de polluants se fait aux laboratoires du ministère de l'Environnement par diverses méthodes, selon le ou les polluants auxquels on s'intéresse. L'analyse du mercure se fait selon un processus automatisé de spectrophotométrie par absorption atomique sans flamme. Des substances organiques comme les PCB, le mirex et les pesticides organochlorés (DDT, aldrine, chlordane, etc.) se mesurent par chromatographie en phase gazeuse. La recherche de dioxine (2,3,7,8-TCDD) à des concentrations de quelques parties par billion se fait au moyen d'une analyse spéciale qui fait appel à la fois à la chromatographie en phase gazeuse et à la spectrométrie de masse.

Selon la méthode, le coût de chaque analyse peut aller de quelques dollars (mercure) à quelque plusieurs centaines de dollars (2,3,7,8-TCDD).

Après l'analyse, les résultats, et les renseignements matériels recueillis au sujet de chaque poisson, servent à établir les tableaux où sont récapitulés, par taille, les conseils de consommation pour chaque espèce et chaque masse d'eau. Les teneurs en contaminant pour chaque taille de poisson sont calculées et évaluées au regard des avis médicaux sur les risques que présente tel contaminant pour la santé de l'homme, tels qu'ils ressortent des divers guides publiés par le gouvernement canadien pour la protection de la santé.

evaluated and the consumption advice for that size and species of fish determined, it is made public by means of regular Environmental Health Bulletins published by the Ministry of the Environment and sent to all news media outlets. Each spring the updated version of the "Guide to Eating Ontario Sport Fish" is published.

### Location identification

Lake names, latitude and longitude, and township, county or territorial district information were obtained from the *Gazeteer of Canada (Ontario)*, published by Energy, Mines, and Resources Canada (1974). For those lakes not listed in the *Gazeteer*, field staff responsible for the fish collection supplied the information.

Information from the Great Lakes was broken down according to statistical districts defined by the Ministry of Natural Resources (see maps). Where possible, separate collections from an individual statistical district were identified according to specific location of capture of the fish.

### Consumption guidelines

The guidelines on page 16 reflect the maximum recommended consumption of fish according to contaminant content and duration of fishing vacation—one-week, two-weeks, three-weeks, and more than three weeks. Fishing holidays should be spaced at least six months apart if the maximum number of meals recommended for fish indicated by the symbol ,  or  has been consumed.

Laboratory analyses are carried out on lean, dorsal muscle tissue and the consumption guidelines are based on this portion of the fish. Persons consuming fish prepared in other ways (eg. whole fish, fish steaks, portions with skin and bone intact, etc.) should be aware that the contaminants PCB, mirex, DDT and 2,3,7,8-TCDD associate with fatty tissue and may be at

Une fois les données de laboratoire évaluées et les conseils de consommation pour la taille et l'espèce de poisson en cause mis au point, cette documentation est diffusée dans les Bulletins sur la sécurité de l'environnement publiés régulièrement par le ministère de l'Environnement et envoyés à tous les points de distribution des moyens d'information. Chaque printemps, on publie la version mise à jour du "Guide pour la consommation du poisson gibier de l'Ontario."

### Identification des emplacements

Les noms des lacs, leur latitude et longitude, le canton, le comté ou le district territorial peuvent être obtenus dans le Répertoire géographique du Canada (Ontario) que publie Énergie, Mines et Ressources Canada (1974). Pour les lacs qui ne sont pas mentionnés dans le Répertoire géographique, le personnel responsable du prélèvement des poissons a fourni les renseignements.

Les renseignements sur les grands lacs ont été obtenus à partir de districts statistiques définis par le ministère des Richesses naturelles (voir cartes). Lorsque cela a été possible, on a identifié des spécimens distincts d'un district particulier, selon l'emplacement de capture du poisson.

### Guide de consommation

Les directives sur page 16 indiquent la quantité maximum de poisson que l'on recommande de consommer en fonction de la teneur en polluant et de la durée des vacances de pêche—une semaine, deux semaines, trois semaines, et plus de trois semaines. Les vacances de pêche devraient être espacées d'au moins six mois si la quantité maximum de repas de poisson  ou  ou  a été consommée.

Les analyses de laboratoire sont effectuées sur le tissu non adipeux du muscle dorsal et le guide de consommation est établi en fonction de cette partie du poisson. Les personnes qui consomment le poisson préparé d'une manière différente (poisson

higher concentrations in the whole fish, fish steaks, etc. than in the sample tested.

If fish indicated in the tables by a  symbol are to be eaten, it is recommended that only boneless, skinless fillets be consumed.

Children under 15 and women of childbearing age should eat only .

### Applying the guidelines

1. No restrictions are placed on consumption of fish in  category according to federal guidelines.
2. Women of childbearing age and children under 15 years of age should eat only fish from  category.
3. Fishing holidays should be spaced at least six months apart if the maximum recommended meals for ,  or  has been consumed.
4. Anglers should not take home fish for later consumption unless it is from  category.
5. A meal is considered to be approximately eight ounces (230 grams).

### How to check your fish

1. Identify the species.
2. Measure length of fish from the tip of the nose to the tip of the tail.
3. Check the tables for the appropriate lake.
4. Note the symbol for the particular fish you are checking.
5. Determine the consumption recommendations from the appropriate consumption guidelines table on page 16.

entier, tranches, portions comprenant la peau et les arêtes, etc.) devraient se rendre compte que les polluants comme les PCB, le mirex, le DDT et le 2,3,7,8-TCDD content d'avantage dans les tissus adipeux et leur présence peut donc être plus concentrée dans le poisson entier, les tranches, etc. que dans l'échantillon analysé.

Il est recommandé de ne consommer que les filets sans arêtes ni peau des poissons classés sous le symbole  dans les tableaux.

Les enfants de moins de 15 ans et les femmes en âge de procréer ne devraient manger que des poissons représentés par .

### Application des directives

1. Pas de restrictions sur la consommation de poissons de la catégorie  selon les directives gouvernementales.
2. Les femmes en âge de procréer et les enfants de moins de 15 ans devraient ne manger que du poisson de la catégorie .
3. Les vacances de pêche devraient être espacées de six mois si l'on consomme le nombre maximum de repas recommandés pour les catégories ,  ou .
4. Les pêcheurs ne devraient pas ramener chez eux des poissons à consommer ultérieurement à moins qu'ils n'appartiennent à la catégorie .
5. Par repas, on entend environ huit onces (230 grammes).

### Comment vérifier votre poisson

1. Identifiez l'espèce.
2. Mesurez la longueur du poisson de la pointe de la bouche au bout de la queue.
3. Cherchez le lac concerné dans les tableaux.
4. Notez le symbole correspondant au poisson que vous cherchez.
5. Déterminer les recommandations de consommation en fonction du tableau de consommation sur page 16.

## Consumption Guidelines

					
One week	No restrictions	10 meals per wk. 2.3 kg./wk. (5.1 lb./wk.)	7 meals per wk. 1.54 kg./wk. (3.4 lb./wk.)	1 or 2 meals/wk. 0.45 kg./wk. (1 lb./wk.)	None
Two weeks	No restrictions	5 meals per wk. 1.3 kg./wk. (2.8 lb./wk.)	4 meals per wk. 0.86 kg./wk. (1.9 lb./wk.)	1 or 2 meals/wk. 0.45 kg./wk. (1 lb./wk.)	None
Three weeks	No restrictions	4 meals per wk. 0.95 kg./wk. (2.1 lb./wk.)	3 meals per wk. 0.63 kg./wk. (1.4 lb./wk.)	1 or 2 meals/wk. 0.45 kg./wk. (1 lb./wk.)	None
Long-term consumption	No restrictions	0.226 kg./wk. (0.5 lb./wk.)	0.136 kg./wk. (0.3 lb./wk.)	1 or 2 meals per month 0.45 kg./mo. (1 lb./mo.)	None

## Guide de consommation

					
Une semaine	Pas de restrictions	10 repas par sem. 2,3 kg/sem. (5,1 lb./sem.)	7 repas par sem. 1,54 kg/sem. (3,4 lb/sem.)	1 ou 2 repas par sem. 0,45 kg/sem. (1 lb/sem.)	Aucun
Deux semaines	Pas de restrictions	5 repas par sem. 1,3 kg/sem. (2,8 lb/sem.)	4 repas par sem. 0,86 kg/sem. (1,9 lb/sem.)	1 ou 2 repas par sem. 0,45 kg/sem. (1 lb/sem.)	Aucun
Trois semaines	Pas de restrictions	4 repas par sem. 0,95 kg/sem. (2,1 lb/sem.)	3 repas par sem. 0,63 kg/sem. (1,4 lb/sem.)	1 ou 2 repas par sem. 0,45 kg/sem. (1 lb/sem.)	Aucun
Consommation à long terme	Pas de restrictions	0,226 kg/sem. (0,5 lb/sem.)	0,136 kg/sem. (0,3 lb/sem.)	1 ou 2 repas par mois 0,45 kg/mois (1 lb/mois)	Aucun

## Contaminant identification

## Identification des polluants

1	Mercury	Mercure
2	Mercury, PCB, mirex and pesticides.	Mercure, PCB, mirex et pesticides
3	PCB, mirex and pesticides	PCB, mirex et pesticides
4	Mercury, PCB and mirex.	Mercure, PCB et mirex
5	Mercury, other metals, PCB, mirex and pesticides.	Mercure, autres métaux, PCB, mirex et pesticides
6	Mercury, other metals.	Mercure et autres métaux
7	2,3,7,8-TCDD (Dioxin)	2,3,7,8-TCDD (dioxine)
8	Toxaphene	Toxaphène

## What about your lake?

The lake selection process is influenced in some cases by the interest shown by anglers. If there are lakes you would like to see tested in the future, please indicate your interest by writing to the appropriate regional or district offices of either of the Ministries of Natural Resources or Environment. A listing of these offices appears at the end of this booklet.

## Contaminant identification

The type of laboratory tests carried out on each species listed in the tables can be determined by noting the small number (1,2,3,4,5,6,7 or 8) that appears after each species name and then checking this number against the following:

### Key to Analysis:

- 1 – Mercury.
- 2 – Mercury, PCB, mirex and pesticides.
- 3 – PCB, mirex and pesticides.
- 4 – Mercury, PCB and mirex.
- 5 – Mercury, other metals, PCB, mirex and pesticides.
- 6 – Mercury, other metals.
- 7 – 2,3,7,8-TCDD.
- 8 – Toxaphene.

### Example:

A species name followed by a 2 has been analysed for mercury, PCB, mirex and pesticides.

The fact that testing for a particular contaminant was carried out does not necessarily mean that the fish will contain this substance.

## Et le lac où vous pêchez?

La sélection des lacs est parfois influencée par l'intérêt des pêcheurs. S'il y a des lacs que vous aimeriez voir tester dans le futur, veuillez en avvertir les bureaux régionaux ou de district concernés du ministère des Richesses naturelles ou de l'Environnement. Vous trouverez la liste de ces bureaux à la fin du guide.

## Identification des polluants

Pour déterminer quel genre d'analyse a été effectué sur chaque espèce figurant dans les tableaux, il suffit de regarder le chiffre (1,2,3,4,5,6,7 ou 8) qui suit le nom de chaque espèce et de le comparer à ce qui suit:

### Genres d'analyses:

- 1 – Mercure.
- 2 – Mercure, PCB, mirex et pesticides.
- 3 – PCB, mirex et pesticides.
- 4 – Mercure, PCB et mirex.
- 5 – Mercure, autres métaux, PCB, mirex et pesticides.
- 6 – Mercure et autres métaux.
- 7 – 2,3,7,8-TCDD.
- 8 – Toxaphène.

### Exemple:

Lorsque le nom d'une espèce est suivi d'un 2 c'est qu'elle a été analysée pour le mercure, les PCB, le mirex et les pesticides.

Le fait que l'analyse a été faite pour un polluant particulier ne signifie pas forcément que le poisson contiendra cette substance.

### **Additional information**

Fish collection and testing is a continuing program of the Ministries of Natural Resources and Environment. **The information contained in this booklet is the best available up to the end of February, 1985.** If the lake you are interested in does not appear in the book, you should check with a local office of either Natural Resources or Environment. New data processed after February, 1985 may be available. **Local offices of MOE and MNR are listed at the end of this booklet.**

Environmental Health Bulletins are issued routinely to supplement data in this booklet.

### **Renseignements supplémentaires**

Le prélèvement et l'étude des poissons est un programme continu des ministères des Richesses naturelles et de l'Environnement. Les renseignements contenus dans cette brochure sont les meilleurs à notre disposition jusqu'à la fin février 1985. Si le lac auquel vous vous intéressez ne figure sur le livre, consultez un bureau local du ministère des Richesses naturelles ou du ministère de l'Environnement. Des nouvelles données ultérieures à février 1985 sont peut-être disponibles. La liste des bureaux locaux du MRN et du MDE se trouve à la fin du guide.

Des bulletins de santé de l'environnement sont publiés mensuellement pour compléter les données contenues dans cette brochure.

## Substances of Interest

### What is a contaminant?

A contaminant is a substance that pollutes air, water, soil or food so that mankind's use of those things is limited.

There are many naturally occurring substances, such as mercury, which, at the levels normally found in air, water and food, pose no hazard to the environment or to human health. However, when levels of such substances exceed government guidelines or objectives, then the substance can be called a contaminant and be said to contaminate or pollute.

Similarly, there are guidelines set by governments for synthetic substances such as PCB, mirex, and dioxin. When the concentrations of these substances exceed stated levels in air, water, soil or food, they too can be called contaminants.

### A. Inorganic substances

#### Mercury

Mercury is a naturally occurring metallic element which, while very dense, is also volatile. It is, therefore, found in very low levels in air and water and also found in rocks, soil and plant and animal matter.

At one time mercury was widely used in chemical plants using the chlor-alkali mercury cell process for manufacturing chlorine and caustic soda. Mercury was also used to control slime growths on wood pulp in pulp and paper mills and to treat seed grains to reduce fungus attacks. However, actions by government and industry in the late 1960's

## Substances en cause

### Qu'est-ce qu'un contaminant?

Un contaminant est une substance qui pollue l'air, l'eau, le sol ou les aliments à un point tel que leur utilisation par l'homme s'en trouve restreinte.

De nombreuses substances, telles que le mercure, se trouvent naturellement dans l'air, l'eau et les aliments; aux concentrations normalement rencontrées, elles ne posent de danger ni pour l'environnement ni pour la santé de l'homme. Mais quand les concentrations dépassent les directives ou objectifs définis par les pouvoirs publics, lesdites substances peuvent être qualifiées de polluants, et l'on peut dire qu'elles contaminent ou polluent le milieu.

Les pouvoirs publics publient de même des directives pour les substances synthétiques comme les PCB, le mirex et la dioxine. Quant ces substances se retrouvent dans l'air, l'eau, le sol ou les aliments à des concentrations qui dépassent les niveaux spécifiés, elles peuvent aussi être qualifiées de contaminants.

### A. Substances inorganiques

#### Mercury

Le mercure est un élément métallique présent dans la nature, très dense et néanmoins volatil. Il se rencontre par conséquent en très faibles concentrations dans l'air et dans l'eau, et aussi dans les roches, le sol et les matières végétales et animales.

Le mercure était naguère très utilisé dans les usines de fabrication de chlore et de soude caustique par la méthode dite chloro-alkaline à bain de mercure. Il servait aussi à empêcher la formation de pellicules sur la pâte de bois dans les papeteries et usines de pâtes à papier, et aussi à traiter les graines de semence pour empêcher qu'elles ne soient attaquées par les champignons. Mais les mesures prises par les pouvoirs publics et par l'industrie vers la fin des années 1960 et le

and early 1970's have virtually eliminated mercury discharges from major industrial sources.

Relatively small amounts of mercury are still used in such diffuse areas as electrical and scientific equipment; a fungicide for golf course greens; and, an amalgam in dental fillings. There is no evidence that limited uses such as these have led to serious environmental problems.

**Mercury**—whether naturally occurring or from an industrial source—attaches to small sediment particles and settles to the lake or river bed. In these bottom sediments micro-organisms convert a portion of most mercury compounds to the organic or methylmercury form.

Methylmercury is rapidly absorbed by a fish either directly from the water passing over its gills or ingested with the organisms which form its diet. Since fish eliminate mercury at a very slow rate, concentrations gradually accumulate.

The longer a fish has been exposed to mercury in the environment and the more mercury contaminated food it has consumed, the higher its mercury level will be. Large or old fish that consume primarily smaller fish will contain much more mercury than smaller and younger fish, or fish that have a varied diet.

Humans eliminate methylmercury at a much faster rate than fish. Therefore, if fish are consumed only during a fishing trip of a few days or weeks, or if anglers limit their long-term intake of mercury-contaminated fish to occasional meals, dangerous levels of methylmercury will not accumulate in the body.

In 1970, it was found that the loss of mercury from a chlor-alkali plant on the St. Clair River had contaminated the fishery of

début des années 1970 ont pratiquement éliminé les rejets de mercure par les principales sources industrielles.

Le mercure s'emploie encore en quantités relativement petites dans des secteurs dispersés comme la fabrication d'équipement électrique et scientifique, de fongicide pour les verts des terrains de golf, et d'un amalgame pour le plombage des dents. Il n'apparaît pas que des emplois restreints de ce genre aient provoqué de graves problèmes écologiques.

Le mercure, qu'il soit présent naturellement ou provienne d'une source industrielle, se fixe sur les petites particules sédimentaires et se dépose sur le fond du lac ou du cours d'eau. Dans les couches sédimentaires du fond, sous l'action de micro-organismes, la plupart des composés de mercure se convertissent en partie en méthylmercure organique.

Le méthylmercure est rapidement absorbé par les poissons, soit directement à partir de l'eau environnante qui traverse les membranes de leurs ouïes, soit par voie alimentaire avec les organismes dont ils se nourrissent. Comme les poissons n'éliminent le mercure que très lentement, des concentrations se forment progressivement.

Plus le poisson aura été longtemps exposé au mercure dans son milieu, et plus il aura consommé d'aliments contaminés par le mercure, plus sa concentration en mercure sera élevée. Les poissons âgés ou de grande taille qui se nourrissent essentiellement de poissons plus petits contiendront beaucoup plus de mercure que les poissons plus petits et plus jeunes, ou que les poissons dont le régime est plus varié.

L'homme élimine le méthylmercure beaucoup plus vite que le poisson. Par conséquent, si le poisson n'est consommé qu'au cours d'une partie de pêche de quelques jours ou de quelques semaines, ou si les pêcheurs limitent leur consommation à long terme de poissons contaminés par le mercure à un repas de temps à autre, il ne s'accumulera pas dans leur organisme de concentrations dangereuses de méthylmercure.

Lake St. Clair to such an extent that the commercial fishery was halted and anglers were advised to "Fish for Fun" only. Immediate action was taken to halt the loss of mercury to the river. Intensive monitoring in lake St. Clair over the past 13 years has shown that the levels of mercury in fish have declined dramatically since 1970. As of 1981, limited commercial fishing has again been permitted on Lake St. Clair.

In the English-Wabigoon River system, mercury pollution from a chlor-alkali plant at Dryden resulted in a curtailment of the commercial fishery and required government to advise anglers to "Fish for Fun".

Annual monitoring of sport fish from several lakes on the English-Wabigoon system has shown that mercury levels have declined significantly in recent years. Current results indicate that limited consumption of smaller fish of certain species from the Wabigoon River and Clay Lake can now be advised. In the lower part of the English River system (Ball, Separation and Tetu lakes) most sizes of fish recently tested have been found to be increasingly suitable for consumption. A limited commercial fishery for species such as whitefish, cisco and suckers has been in operation since 1978.

Medical authorities have learned a great deal about mercury poisoning in humans from a number of epidemics. In Japan, for example, people were poisoned by eating fish from Minamata Bay which had been contaminated by mercury discharged from the Chisso Chemical Company. The term for mercury poisoning "Minamata Disease" was coined after this epidemic. Wide scale mercury poisoning also occurred in Iraq after

En 1970, il a été constaté qu'un rejet de mercure d'une usine de chlore et de soude caustique sur la rivière Sainte-Clair avait pollué les pêches du lac Sainte-Clair au point qu'il a fallu interrompre la pêche commerciale et conseiller aux pêcheurs à la ligne de ne pêcher que pour le sport. Des mesures immédiates ont été prises pour arrêter les rejets de mercure dans la rivière. Une surveillance intensive du lac Sainte-Clair depuis 13 ans a permis de constater une diminution spectaculaire des concentrations de mercure dans les poissons depuis 1970. En 1981, la pêche commerciale était de nouveau permise, à une échelle limitée, sur le lac Sainte-Clair.

Dans le bassin hydrographique de l'English et de la Wabigoon, la pollution des eaux par le mercure provenant d'une usine de chlore et de soude caustique sise à Dryden a obligé à restreindre la pêche commerciale et à conseiller officiellement aux pêcheurs à la ligne de ne pêcher que pour le sport.

La surveillance annuelle du poisson gibier dans plusieurs lacs du bassin des rivières English et Wabigoon a permis de constater que les concentrations de mercure accusent une baisse sensible depuis quelques années. Les plus récents résultats d'analyses indiquent que l'on peut maintenant permettre une consommation limitée des petits poissons de certaines espèces pêchées dans la rivière Wabigoon et le lac Clay. En aval du bassin de la rivière English (les lacs Ball, Separation et Tetu) la plupart des poissons de différentes tailles analysés récemment semblent se prêter de plus en plus à la consommation. On se livre, depuis 1978, à une pêche commerciale limitée d'espèces comme la grande corégone, le cisco et les meuniers.

C'est d'un certain nombre d'épidémies d'intoxication humaine par le mercure que les autorités médicales tiennent une bonne partie de ce qu'elles savent sur la question.

people mistakenly ate seed grain treated with a fungicide containing mercury. In both cases, people accumulated more than 20 milligrams of mercury in their body before any effects of poisoning became apparent. This 20 milligram level is much higher than the average 2 to 3 milligram level of mercury normally found in Canadians.

The central nervous system is most affected by methylmercury. Some signs of poisoning include: lack of co-ordination; the feeling of "pins and needles"; numbness of the lips and mouth; constricted visual field; night blindness; tremor; deafness; and, diminished taste and smell. It should be pointed out that many of the symptoms listed above are common to other ailments not associated with mercury poisoning. Extensive medical testing would be required to determine any case of mercury poisoning.

The consumption guidelines developed for use by Ontario's anglers are based on federal guidelines supplemented by consumption recommendations prepared by the World Health Organization and supported by medical evidence gained through study of the methylmercury poisoning epidemics in Japan and Iraq.

Consumers following the guidelines can be assured that mercury levels in their bodies will remain far below levels where symptoms of poisoning begin to appear. The guidelines were developed for adults and, since the mercury level within the body is directly related to body weight, extra caution must be taken to protect a child or a fetus. Therefore, it is recommended that children under 15 years of age and women of childbearing age should consume only those fish with a mercury

Au Japon, par exemple, des personnes furent empoisonnées pour avoir mangé du poisson de la Baie de Minamata, contaminé par des rejets de mercure de la Société de produits chimiques Chisso. C'est après cette épidémie qu'on a baptisé l'intoxication par le mercure "maladie de Minamata". Une autre très forte épidémie d'intoxication eut lieu en Iraq du fait de l'ingestion accidentelle de semences traitées avec un fongicide à base de mercure. Dans ces deux cas, l'accumulation de mercure dans l'organisme avait atteint plus de 20 milligrammes avant que les effets toxiques ne se manifestent. Cette quantité de 20 milligrammes est beaucoup plus élevée que la quantité moyenne (2 à 3 milligrammes) généralement observée chez les Canadiens.

C'est le système nerveux central qui est le plus affecté par le méthylmercure. Entre autres symptômes d'intoxication, on note: de l'ataxie; des picotements anormaux (parésie); une perte de sensibilité des lèvres et de la bouche; un rétrécissement du champ visuel; de la cécité nocturne; des tremblements; de la surdité et une diminution de l'acuité du goût et de l'odorat. A noter que nombre de ces symptômes se rencontrent aussi dans d'autres maladies non associées à l'empoisonnement par le mercure. Des contrôles médicaux poussés seraient nécessaires pour déterminer qu'il s'agit d'un cas d'empoisonnement par le mercure.

Les directives de consommation mises au point à l'intention des pêcheurs à la ligne de l'Ontario sont fondées sur les directives fédérales, plus les recommandations établies en la matière par l'Organisation mondiale de la santé et appuyées par l'expérience médicale tirée de l'étude des épidémies d'intoxication par le méthylmercure au Japon et en Iraq.

Les consommateurs qui respectent ces directives peuvent être assurés que les concentrations de mercure dans leur organisme resteront très au-dessous du niveau où les symptômes d'intoxication commenceraient à se manifester.

content of less than 0.5 parts per million, the federal guideline for commercially marketed fish. Fish with less than 0.5 parts per million mercury are identified in the tables of this book by .

Fish containing between 0.5 and 1.0 parts per million, identified by , and fish with 1.0 to 1.5 parts per million, identified by , can be eaten by adults (except women of childbearing age) in restricted amounts as indicated in the consumption guidelines. Fish with mercury levels in excess of 1.5 parts per million, identified by , should not be consumed.

### Other Metals

There are metals other than mercury which are found in fish. Many of these metals are in wide daily use by industry and commerce and so residues of them inevitably find their way into the aquatic environment. Metals such as copper (Cu), nickel (Ni), zinc (Zn), cadmium (Cd), manganese (Mn), chromium (Cr), arsenic (As) and selenium (Se) can be analyzed by the laboratories of the Ministry of the Environment. All have been found in trace levels in fish. Copper, nickel, zinc, cadmium, manganese, chromium, arsenic and selenium have not been found at levels which would lead to any need to suggest restrictions on the consumption of fish.

In 1983, concerns were raised about the possibility of elevated levels of lead, both in the organic and inorganic forms in fish from the St. Lawrence River in the immediate area of Maitland and in the St. Clair River around Stag Island.

Fish containing more than 1.0 parts per million lead, should be eaten only by adults on an occasional meal basis as outlined in the fish consumption guidelines. Women of childbearing age and children under the age of 15 years should not consume fish indicated as having more than 1.0 ppm lead. Such fish are identified by the symbol .

Les directives ont été élaborées pour des adultes, et étant donné que la concentration de mercure dans l'organisme est directement fonction du poids du corps, la protection de l'enfant ou du fœtus appelle des précautions toutes particulières. Il est donc recommandé que les enfants de moins de 15 ans et les femmes en âge de procréer ne consomment que du poisson dont la concentration de mercure est inférieure à 0,5 partie par million, montant prescrit dans la directive fédérale pour le poisson vendu dans le commerce. Les poissons dont la concentration de mercure est inférieure à 0,5 partie par million sont désignés dans la présente brochure par .

Les poissons qui contiennent de 0,5 partie à 1 partie par million, désignés par , et ceux qui contiennent de 1,0 à 1,5 partie par million, désignés par , peuvent être consommés par les adultes (à l'exception des femmes en âge de procréer) en quantités limitées, ainsi qu'il ressort des directives de consommation. Les poissons contenant plus de 1,5 partie par million, et désignés par , sont à éviter.

### Autres métaux

Divers métaux autres que le mercure sont décelés dans le poisson. Plusieurs de ces métaux sont couramment utilisés chaque jour dans l'industrie et le commerce aussi il est inévitable d'en trouver des résidus dans l'environnement aquatique. Les laboratoires du ministère de l'Environnement de l'Ontario sont capables de déceler les métaux tels que le cuivre (Cu), le nickel (Ni), le zinc (Zn), le cadmium (Cd), le manganèse (Mn), le chrome (Cr), l'arsenic (As) et le sélénium (Se). Tous ces métaux ont été décelés à l'état de trace dans le poisson. Cependant, on n'a pas trouvé de concentrations de cuivre, de nickel, de zinc, de cadmium, de manganèse, de chrome, d'arsenic et de sélénium telles qu'il faille suggérer de réduire la consommation du poisson.

En 1983, on s'est alarmé de la présence possible de fortes concentrations de plomb, sous forme organique ou inorganique, dans les poissons du fleuve Saint-Laurent dans le voisinage immédiat de Maitland et de la rivière St. Clair, près de l'île Stag.

## B. Organic substances

Fish indicated in the tables by the  symbol which have been tested for one or more organic contaminants (PCB, DDT, mirex, pesticides or 2,3,7,8-TCDD) are suitable for unrestricted consumption according to Federal government guidelines. When the  symbol is used, it indicates that the fish species tested exceeded one or more of the Federal guidelines for organic chemicals and that restricted consumption (or no consumption in the cases of women of childbearing age and children under 15 years of age) should be practised.

Federal guidelines for various organic contaminants are as follows:

PCB	- 2.0 parts per million
DDT	- 5.0 parts per million
mirex	- 0.1 part per million
2,3,7,8-TCDD	- 20 parts per trillion

Details on the particular contaminants which result in the limited consumption recommendation in each case can be obtained by contacting:

Les poissons dont la teneur plus de 1,0 partie par million de plomb ne devraient être consommés que par des adultes à raison d'un repas de temps en temps, comme l'indique de guide de consommation. Les femmes en âge de procréer et les enfants de moins de 15 ans doivent éviter de consommer du poisson dont la teneur en plomb dépasse 1,0 ppm. Ces poissons sont désignés par le symbole .

## B. Substances organiques

Les poissons désignés dans les tableaux par le symbole  et ayant fait l'objet d'analyses pour déterminer la présence d'un ou plusieurs contaminants organiques (PCB, DDT, mirex, pesticides ou dioxine) peuvent être consommés sans restriction conformément aux directives fédérales. Lorsque le poisson est désigné par , cela signifie que l'espèce de poisson contrôlée dépassait des limites prescrites dans une ou plusieurs des directives fédérales concernant les produits chimiques organiques, et qu'il convient d'en restreindre la consommation (ou de s'en abstenir dans le cas des femmes en âge de procréer ou des enfants de moins de 15 ans).

Les directives fédérales touchant les divers polluants prescrivent les seuils suivants:

PCB	- 2,0 parties par million
DDT	- 5,0 parties par million
mirex	- 0,1 partie par million
2,3,7,8-TCDD	- 20 parties par trillion

### **Polychlorinated Biphenyls (PCBs)**

PCBs are a group of chlorinated organic compounds first commercially developed in the late 1920's. They are not of natural origin or formed in the natural environment so their presence can always be attributed to man's activities. PCBs are stable and relatively inert compounds: they break down very slowly in the environment and are destroyed by burning only at very high temperatures. These properties led to widespread use of PCBs as electrical transformer insulating fluids, extreme pressure oils and greases, hydraulic fluids, and as fire retardants and plasticizers in products such as paints, inks, caulking compounds and sealants.

PCBs tend to persist for years in the natural environment. This, coupled with the fact that they bioaccumulate readily in the aquatic ecosystem, has meant that "top predator" species of fish with high fat content in their bodies have, in some Ontario waters, accumulated PCBs to contaminating levels.

Pour plus de précisions sur ce qui, dans le cas de chaque polluant, amène à recommander d'en limiter la consommation, s'adresser à:

### **Biphényles polychlorés (PCB)**

Les PCB sont un groupe de composés organiques chlorés dont la mise au point à des fins commerciales remonte à la fin des années 1920. N'étant pas d'origine naturelle ni formés dans l'environnement naturel, leur présence est invariablement attribuable à l'activité de l'homme. Les PCB sont des composés stables et relativement inertes. Ils ne se décomposent que très lentement dans l'environnement et ne sont détruits par combustion qu'à des températures très élevées. Ces caractéristiques ont encouragé l'emploi des PCB comme fluides isolants pour les transformateurs, dans la fabrication des huiles et graisses à haute pression, comme fluides hydrauliques et comme ignifuges et plastifiants dans des produits comme les peintures, les encres, les mastics et les pâtes à calfeutrer.

La tendance des PCB à persister pendant des années dans l'environnement naturel, jointe au fait de leur bioaccumulation dans l'écosystème aquatique, fait que chez certaines espèces de gros poissons prédateurs à tissus particulièrement adipeux de certaines eaux de l'Ontario, les PCB se sont accumulés en concentration suffisante pour avoir un effet contaminant.

In the early part of the 1970's, when it was discovered that high levels of PCBs could accumulate in the environment, their sale for "open-ended" uses was curtailed. More recent Canadian regulations effectively ban the further importation of PCBs for any expansion of its remaining permitted uses such as insulating fluid in closed electrical power transformers and capacitors. Strict regulations for the storage and disposal of PCBs and PCB contaminated equipment minimize the chance of further losses of PCB to the environment.

These user restrictions have resulted in declining levels of PCBs in the aquatic ecosystem, as demonstrated by recent sport fish and minnow data.

PCBs are of human health concern because of two types of effects which have been identified in scientific studies. PCBs are considered to be cancer causing and have been shown to affect normal fertility, pregnancy, birth and development of offspring when tested on laboratory animals. Therefore, very restrictive guidelines regarding human consumption of fish with even small amounts of PCB have been established.

The federal guideline for the commercial sale of fish containing PCB is 2.0 parts per million. The angler's guidelines contained in this book, based on the advice of medical specialists, suggest that fish with PCB above 2.0 ppm should be eaten only by adults (except women of childbearing age) on an occasional meal basis as outlined in the consumption guidelines. Women of childbearing age and children under the age of 15 years should not consume fish indicated as having more than 2.0 ppm PCB in its flesh. Such fish are identified in the tables by the general organic contaminant restricted consumption symbol .

Au début des années 1970, quand on a découvert que des concentrations élevées de PCB pouvaient se former dans l'environnement, ils ont cessé d'être mis en vente sans limitation de destination. Des réglementations canadiennes plus récentes interdisent en pratique toute nouvelle importation de PCB qui en étendrait l'emploi même dans les secteurs où leur utilisation demeure permise, par exemple comme fluide isolant dans les transformateurs et condensateurs électriques hermétiquement clos. Une stricte réglementation du stockage et de la mise au rebut des PCB et des matériels contaminés par les PCB réduit à un minimum la possibilité de nouveaux rejets de PCB dans l'environnement.

Ces restrictions d'utilisation ont fait baisser les concentrations de PCB dans l'écosystème aquatique, ainsi qu'il ressort des constatations récentes relatives aux poissons de pêche sportive et à leur frai.

Les préoccupations qu'inspirent les PCB tiennent à deux types d'effets relevés lors d'études scientifiques. Les PCB sont considérés comme cancérogènes et il a été démontré par des essais en laboratoire sur les animaux qu'ils pouvaient affecter la fécondité et le cours de la grossesse, ainsi que la naissance et le développement de l'enfant. D'où les directives très restrictives quant à la consommation humaine de poisson contenant des quantités même minimes de PCB.

La directive fédérale pour la mise en vente de poisson contenant des PCB prescrit un seuil de 2,0 parties par million. Selon les directives à l'intention des pêcheurs à la ligne contenus dans la présente brochure et fondées sur les avis de médecins spécialistes, les poissons dont la teneur en PCB dépasse 2,0 ppm ne devraient être consommés que par des adultes (à l'exception des femmes en âge de procréer) à raison d'un repas de temps en temps, comme indiqué le guide de consommation. Les femmes en âge de procréer et les enfants

### Mirex (Dechlorane)

Mirex is a chlorinated carbon compound used as a pesticide in the southern United States, but never registered for such use in Canada. Because of its chemical stability, mirex, also known as "Dechlorane", was used by two southern Ontario companies in the 1960's as a fire retardant in their manufactured products.

Mirex has been detected primarily in fish from Lake Ontario. The sources were found to be a former processor of mirex in Niagara Falls, New York and a manufacturing plant in Oswego, New York. Mirex has not been detected in water or fish from sources adjacent to the two former Ontario users.

The behavior of mirex in the aquatic environment is similar to that of PCBs in that it is slowly broken down and destroyed by natural processes. It, too, has a high affinity for fats. Following ingestion, mirex accumulates in the fatty tissues of fish. Animal experiments have shown that mirex is a possible cause of cancer.

The provisional guideline for the commercial sale of fish containing mirex is 0.1 parts per million. The angler's guidelines contained in this book suggest that fish with mirex above 0.1 ppm should be eaten only by adults on an occasional meal basis as outlined in the fish consumption guidelines. Women of childbearing age and children under the age of 15 years should not consume fish indicated as having more than 0.1 ppm mirex in its flesh. Such fish are identified in the tables by the general organic contaminant restricted consumption symbol .

de moins de 15 ans doivent éviter de consommer du poisson dont la teneur en PCB dépasse 2,0 ppm. Ces poissons sont désignés dans les tableaux par le symbole  qui, d'une manière générale, signifie qu'il ne faut en faire qu'une consommation restreinte pour cause de contamination par substances organiques.

### Mirex (Déchlorane)

Le mirex est un hydrocarbure chloré utilisé comme pesticide dans le sud des États-Unis, mais qui n'a jamais été enregistré pour ce genre d'emploi au Canada. En raison de sa stabilité chimique, le mirex, également connu sous l'appellation de déchlorane, a été utilisé dans les années 1960 par deux sociétés du sud de l'Ontario comme ignifuge dans leurs produits manufacturés.

La présence de mirex a été décelée principalement dans des poissons du lac Ontario. La source s'en est révélée être une ancienne usine de transformation de mirex à Niagara Falls (New York) et une manufacture d'Oswego (New York). On n'a pas relevé la présence de mirex dans l'eau ni dans les poissons provenant du voisinage des deux anciens utilisateurs sis en Ontario.

Dans l'environnement aquatique, le mirex se comporte comme les PCB, autrement dit il se décompose lentement par des processus naturels. Il a également une affinité marquée pour les graisses et, une fois absorbé par les poissons, s'accumule dans leurs tissus adipeux. Les expériences menées sur des animaux indiquent que le mirex est une cause possible de cancer.

La directive provisoire pour la mise en vente de poisson contenant du mirex prescrit un seuil de 0,1 partie par million. Selon les directives à l'intention des pêcheurs à la ligne contenues dans la présente brochure, les poissons contenant plus de 0,1 ppm de mirex ne devraient être consommés que par des adultes (à l'exception des femmes en âge de procréer) à raison d'un repas de temps en temps, comme l'indique le guide de consom-

## DDT

DDT was developed during the Second World War to control a wide variety of insects.

Afterwards, it gained widespread use as an insecticide for agricultural and public health use. DDT, like PCBs and mirex, is not easily broken down in the natural environment. The accumulation of DDT in fish caused markedly reduced reproductive capability in a number of species and led to restrictions in its use in the mid-1960's. In 1969, provisions of Ontario's Pesticides Control Act limited its use to very specific purposes by special permit only. Substantial reductions of DDT levels in fish have resulted from these actions.

Like PCB and mirex, DDT accumulates in the fatty tissue of fish. The federal guideline for the commercial sale of fish containing DDT is 5.0 parts per million. The angler's guidelines contained in this book recommend that fish with DDT levels above 5.0 ppm should be eaten only by adults on an occasional meal basis as outlined in the consumption guidelines. Women of child-bearing age and children under the age of 15 years should not consume fish indicated as having more than 5.0 ppm DDT in its flesh. Such fish are identified in the tables by the general organic contaminant restricted consumption symbol .

## 2,3,7,8-TCDD (Dioxin)

The dioxin group of chemicals consists of 75 separate, chlorinated substances or isomers which differ significantly from one another in chemical properties, toxicity and degree of persistence in the environment. None of these dioxins are in themselves useful chemicals, rather they occur in trace amounts during the production of various other chemicals. The 2,3,7,8-tetrachloro-dibenzo-p-dioxin isomer, also known as 2,3,7,8-TCDD, may be formed in trace

mation. Les femmes en âge de procréer et les enfants de moins de 15 ans doivent éviter de consommer du poisson dont la teneur en mirex dépasse 0,1 ppm. Ces poissons sont désignés dans les tableaux par le symbole  qui, d'une manière générale, signifie qu'il ne faut en faire qu'une consommation restreinte pour cause de contamination par substances organiques.

## DDT

Le DDT a été mis au point pendant la deuxième guerre mondiale pour lutter contre toutes sortes d'insectes. Son emploi s'est largement répandu par la suite comme insecticide dans l'agriculture et l'hygiène publique. Le DDT, comme les PCB et le mirex, ne se décompose pas facilement dans le naturel milieu. L'accumulation de DDT dans les poissons a sensiblement réduit la capacité reproductive d'un certain nombre d'espèces et a amené à restreindre l'emploi de cette substance vers le milieu des années 1960. En 1969, les dispositions de la loi de l'Ontario sur le contrôle des pesticides a limité l'emploi du DDT à des utilisations très précises et sous réserve de l'obtention d'un permis spécial. Ces mesures ont sensiblement réduit la concentration de DDT dans les poissons.

Comme les PCB et le mirex, le DDT s'accumule dans les tissus adipeux des poissons. La directive fédérale pour la mise en vente de poisson contenant du DDT prescrit un seuil de 5,0 parties par million. Selon les directives à l'intention des pêcheurs à la ligne contenues dans la présente brochure, les poissons contenant plus de 5,0 ppm de DDT ne devraient être consommés que par des adultes (à l'exception des femmes en âge de procréer) à raison d'un repas de temps en temps, comme l'indique le guide de consommation. Les femmes en âge de procréer et les enfants de moins de 15 ans doivent éviter de consommer du poisson dont la teneur en DDT dépasse 5,0 ppm. Ces poissons sont désignés dans les tableaux par le symbole  qui, d'une manière générale,

quantities in the manufacture of 2,4,5-trichlorophenol, a chemical which is then used to manufacture the herbicide 2,4,5-T. Use of this herbicide was discontinued in Ontario in 1979.

2,3,7,8-TCDD has a high acute toxicity to certain laboratory test animals. It is considered to be a carcinogen and teratogen at very low doses to test animals; it may therefore have a potential to cause cancer and birth defects in humans.

Other commercial products, such as pentachlorophenol and some formulations of the herbicide 2,4-D, have recently been found to contain other dioxin isomers whose toxicities are less than that of 2,3,7,8-TCDD.

In the latter part of 1980, the Ministry of the Environment's dioxin laboratory became operational and in July, 1981, the first results for fish from various locations in the Great Lakes were published. While the laboratory can analyze several thousand fish each year for substances such as mercury and PCB, the exacting procedure of analyzing extremely minute (parts per trillion) concentrations of dioxin, limits the number of fish species and locations that can be evaluated. Sampling to date has concentrated in the Great Lakes and Niagara River. Locations where dioxin testing has been carried out are identified in the tables of this guide book by a number "7" after the fish species name.

In July, 1981 the Canadian Department of National Health and Welfare established an interim tolerance level for 2,3,7,8-TCDD in fish of 20 parts per trillion.

Fish species found to contain no detectable 2,3,7,8-TCDD or where 2,3,7,8-TCDD averaged less than 20 ppt are indicated by the symbol . Fish species averaging greater than the 20 ppt are identified by the general organics restricted consumption symbol .

signifie qu'il ne faut en faire qu'une consommation restreinte pour cause de contamination par substances organiques.

### 2,3,7,8-TCDD (Dioxine)

Le groupe des dioxines se compose de 75 substances chlorées distinctes ou de leurs isomères, qui diffèrent sensiblement les unes des autres par leurs propriétés chimiques, leur toxicité et leur degré de persistance dans l'environnement. Aucune de ces dioxines n'est en elle-même un produit chimique utile; elles se rencontrent sous forme de traces au cours de la production d'autres produits chimiques. Le 2,3,7,8 tétrachlorodibenzo-p-dioxine, isomère également connu sous le nom de 2,3,7,8-TCDD ou dioxine, peut apparaître sous forme de traces lors de la fabrication de 2,4,5 trichlorophénol, lequel sert ensuite à fabriquer l'herbicide 2,4,5-T. Cet herbicide n'est plus employé en Ontario depuis 1979.

Le 2,3,7,8-TCDD s'est avéré très toxique lors d'essais menés en laboratoire sur certains animaux. On estime qu'à très faibles doses, il exerce des effets cancérogènes et tératogènes sur les animaux de laboratoire; il pourrait donc éventuellement causer un cancer ou des déformations congénitales chez les êtres humains.

On a récemment constaté la présence d'autres isomères dioxiniques de toxicité moindre que celle du 2,3,7,8-TCDD dans d'autres produits commerciaux, comme le pentachlorophénol et certaines formes d'herbicide 2,4-D.

Le laboratoire du ministère de l'Environnement s'occupant de la dioxine est entré en service vers la fin de 1980, et c'est en juillet 1981 qu'ont été publiés les premiers résultats de l'analyse de poissons provenant de divers emplacements des Grands Lacs. Le laboratoire peut analyser plusieurs milliers de poissons par an pour déterminer la présence de substances comme le mercure ou les PCB; en revanche, l'extrême précision nécessaire pour déterminer des concentrations infimes

## Pesticides

In addition to analyses for the organic chemicals PCB and mirex (Dechlorane) and the pesticide DDT, a number of other organic chemicals, chiefly pesticides, can be studied in the same laboratory testing procedure. It should be noted that when testing is indicated as having included these substances it does not always mean that they have been detected. It may (and often does) mean that these substances were analyzed for, but were not found. These substances are HCB (hexachlorobenzene) and the pesticides lindane, heptachlor, aldrin, chlordane and toxaphene. They have not been detected at levels which would lead to any need to suggest restrictions on the consumption of fish.

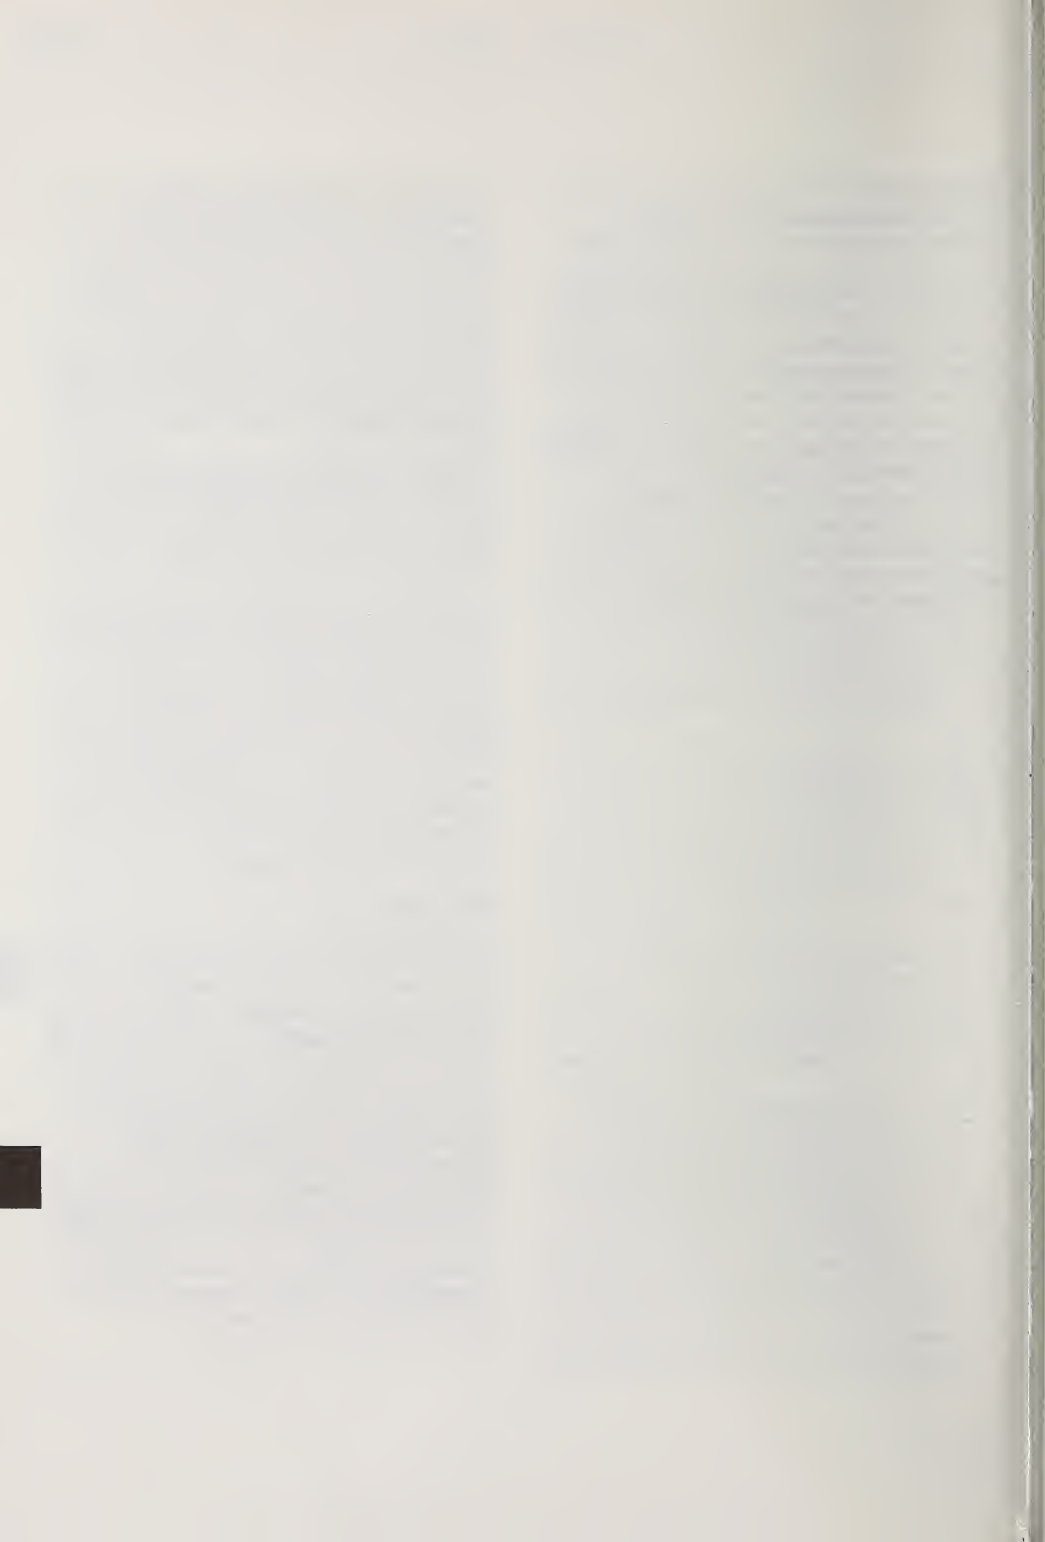

(parties par trillion) de dioxine limite radicalement le nombre d'espèces de poissons et les emplacements qu'il est possible d'évaluer. Jusqu'à présent, les prélèvements ont été faits principalement dans les Grands Lacs et dans la rivière Niagara. Les emplacements où l'on a procédé à des analyses pour déceler la présence de dioxine sont désignés dans les tableaux du présent guide par le chiffre 7 après le nom de l'espèce de poisson.

En juillet 1981, le ministère canadien de la Santé nationale et du Bien-être social a établi provisoirement un niveau de tolérance de 20 parties par billion de 2,3,7,8-TCDD dans les poissons.

Les espèces de poisson qui ne contiennent aucune concentration perceptible de 2,3,7,8-TCDD ou dont la concentration moyenne en 2,3,7,8-TCDD est inférieure à 20 ppt sont désignées par le symbole . Les espèces contenant des concentrations supérieures à 20 parties par trillion sont désignées par le symbole  qui, d'une manière générale, signifie qu'il ne faut en faire qu'une consommation restreinte pour cause de contamination par substances organiques.

## Pesticides

Outre les analyses concernant les composés organiques PCB et mirex (Dechlorane) ainsi que le pesticide DDT, bon nombre d'autres composés organiques, surtout des pesticides, peuvent être recherchés en suivant le même procédé d'analyse. On doit bien noter que s'il est indiqué que le test a porté sur ces substances, cela ne signifie pas nécessairement qu'on les a décelées. Très souvent, ces substances n'ont pas été décelées. Ces substances sont les suivantes le HCB (hexachlorobenzène) et les pesticides lindane, heptachlore, aldrine et chlordane, et toxaphène. Elles n'ont pas été décelées en quantité telle qu'il faille suggérer de réduire la consommation du poisson.

## Fish Identification

The consumption advice provided in this book is related to specific species of fish and, in order to use the information properly, it is important to correctly identify the species of fish caught.

Such identification usually presents no problem to the dedicated angler, but people new to the sport may sometimes have a bit of trouble determining the type of fish that they have caught and wish to eat.

On the following pages are sketches of the types of the fish most commonly sought in Ontario. Accompanying each picture is a brief description of the length and weight ranges of adult fish that anglers are likely to catch from Ontario's lakes and streams. For those fishermen lucky enough to land a "lunker", the record size of many species are provided for comparison.

## Identification des poissons

Les conseils de consommation donnés dans la présente brochure portent sur des espèces particulières de poisson, et pour tirer rationnellement parti de cette information, il importe d'identifier correctement les espèces de poisson que l'on prend.

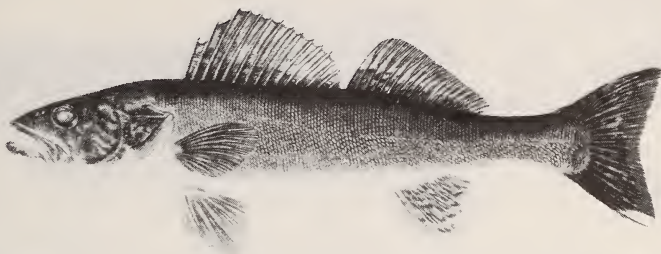

Cette identification ne présente d'ordinaire pas de difficulté pour le pêcheur chevronné, mais les novices risquent d'avoir parfois un peu de mal à déterminer quel est le poisson qu'ils ont pris et ont envie de manger.

On trouvera dans les pages qui suivent des croquis des types de poissons qui se pêchent le plus souvent en Ontario. Chaque image est accompagnée d'une brève description indicative de la fourchette de dimensions et de poids où se situeront les poissons adultes que le pêcheur à la ligne a des chances de pêcher dans les eaux des lacs et cours d'eau de l'Ontario. Pour ceux qui auraient la chance de sortir une "grosse pièce", la taille record est indiquée pour beaucoup d'espèces aux fins de comparaison.

**Truite arc-en-ciel**

Length / longueur: 15-75 cm  
6-30 in

Weight / poids: 0.2-5.5 kg  
0.5-12 lb

Record (Ontario): 97.8 cm/13.21 kg  
38.5 in/29.1 lb

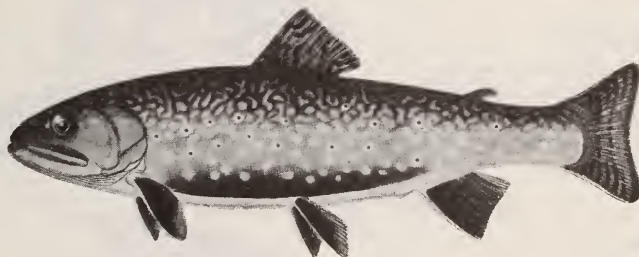

---

**Speckled Trout**  
**Truite mouchetée**

Length / longueur: 15-40 cm  
6-16 in

Weight / poids: 0.2-0.9 kg  
0.5-2 lb

Record (Ontario): 80.0 cm/6.58 kg  
31.5 in/14.5 lb

---

**Brown Trout**  
**Truite brune**

Length / longueur: 15-65 cm  
6-16 in

Weight / poids: 0.2-4.5 kg  
0.5-10 lb

Record (Ontario): 82.8 cm/11.14 kg  
32.6 in/24.5 lb

## Whitefish Grande corégone

Length / longueur: 30-65 cm  
12-26 in

Weight / poids: 0.3-4.0 kg  
0.5-9 lb

Record (Ontario): 81.3 cm/6.3 kg  
32.0 in/14.0 lb

Profiles of whitefish and herring showing differences due to position of snout or upper jaw.

### Whitefish

A. The mouth is overhung by the snout or upper jaw; rounded profile. Whitefish (*Coregonus clupeaformis*).

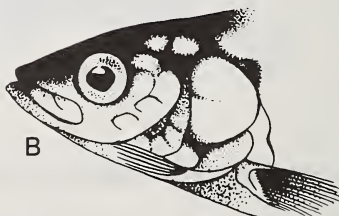

Profils du corégone et du cisco: remarquez la position du museau (mâchoire supérieure).

### Grande corégone

A. Le museau (mâchoire supérieure) est en saillie sur la bouche. Profil arrondi. Corégone. (*Coregonus clupeaformis*).

### Cisco

B. The mouth is not overhung by the snout; pointed profile. Lake herring, (*Coregonus artedii*).

### Cisco de lac

B. Le museau n'est pas proéminent; profil pointu. Cisco de lac. (*C. artedii*)

## Cisco (Lake Herring) Cisco de lac (Hereng de lac)

Length / longueur: 20-30 cm  
8-12 in

Weight / poids: 0.3-0.5 kg  
0.5-1 lb

---

**Channel Catfish**  
**Barbue de rivière**

Length / longueur: 36-53 cm  
14-21 in

Weight / poids: 0.9-1.8 kg  
2-4 lbs

---

**Brown Bullhead**  
**Barbotte brune**

Length / longueur: 20-36 cm  
8-14 in

Weight / poids: 0.3-0.45 kg  
0.8-1 lb

---

**Carp**  
**Carpe**

Length / longueur: 30-75 cm  
12-30 in

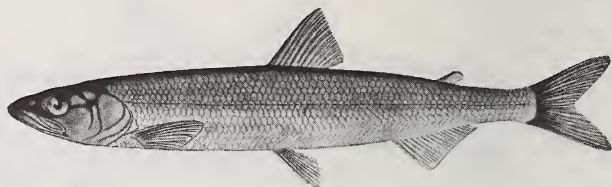

Weight / poids: 0.5-11.0 kg  
1-24 lb

---

**Rainbow Smelt**  
**Éperlin arc-en-ciel**

Length / longueur: 15-25 cm  
6-10 in

---

**White Sucker**  
**Meunier noir**

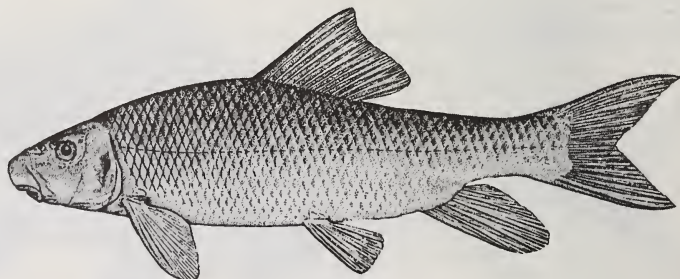

Length / longueur: 30-50 cm  
12-20 in  
Weight / poids: 0.45-0.9 kg  
1-2 lb

---

**Redhorse Sucker**  
**Suceur rouge**

Length / longueur: 30-45 cm  
12-18 in  
Weight / poids: 0.45-0.9 kg  
1-2 lb

---

**White Bass**  
**Bar blanc**

Length / longueur: 20-30 cm  
8-12 in

Weight / poids: to 0.7 kg  
1.5 lbs

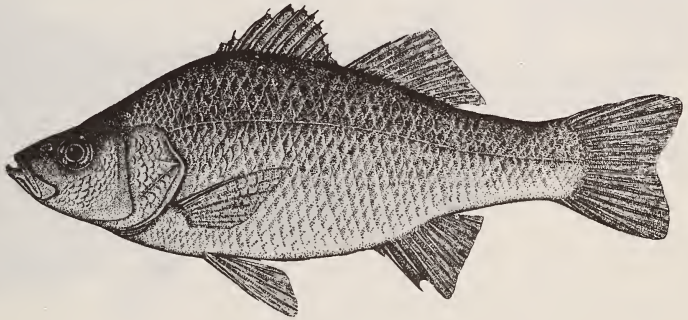

---

**White Perch**  
**Bar-perche**

Length / longueur: 15-25 cm  
6-10 in

Weight / poids: 0.2-0.5 kg  
0.5-1 lb

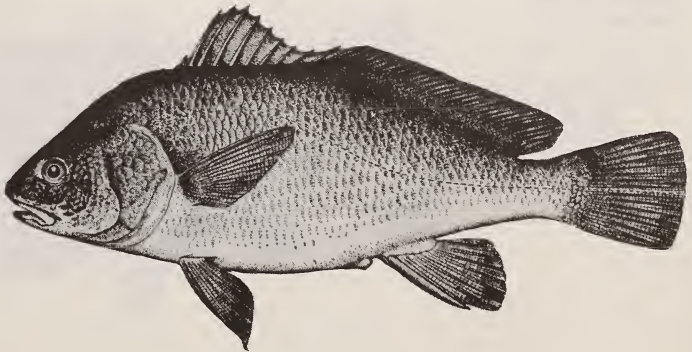

---

**Freshwater Drum**  
**Malachigan**

Length / longueur: 45-50 cm  
18-20 in

Weight / poids: 0.5-1.0 kg  
1-2 lb

15 in

Fish Names<sup>1</sup>Noms des poissons<sup>1</sup>

English Common Name	Nom français	Scientific Name Nom scientifique
Sea Lamprey	Lamproie marine	<i>Petromyzon Marinus</i> (Linnaeus)
Sturgeon, Lake Sturgeon	Esturgeon de lac, charbonnier	<i>Acipenser fulvescens</i> (Rafinesque)
Longnose Gar	Lépisosté osseux	<i>Lepisosteus osseus</i> (Linnaeus)
Bowfin, dogfish, lawyer	Poisson-castor	<i>Amia calva</i> (Linnaeus)
Alewife	Gaspereau	<i>Alosa pseudoharengus</i> (Wilson)
Gizzard shad, Shad, sawbelly	Alose à gésier	<i>Dorosoma cepedianum</i> (Lesueur)
Pink Salmon	Saumon rose	<i>Oncorhynchus gorbuscha</i> (Walbaum)
Coho Salmon	Saumon coho	<i>Oncorhynchus kisutch</i> (Walbaum)
Kokanee Salmon	Saumon nerka	<i>Oncorhynchus nerka</i> (Walbaum)
Chinook Salmon	Saumon chinook	<i>Oncorhynchus tshawytscha</i> (Walbaum)
Rainbow Trout, Steelhead Trout	Truite arc-en-ciel	<i>Salmo gairdneri</i> (Richardson)
Brown Trout	Truite brune	<i>Salmo trutta</i> (Linnaeus)
Brook Trout, Speckled Trout, Square-tail, aurora Trout	Truite mouchetée, omble de fontaine	<i>Salvelinus fontinalis</i> (Mitchill)
Lake Trout, Grey Trout, Laker, Namaycush	Truite de lac, truite grise, touladi	<i>Salvelinus namaycush</i> (Walbaum)
Siscowet, fat Lake Trout, fat	Siscowet	<i>Salvelinus namaycush siscowet</i> (Agaissiz)
Splake, Wendigo	Splake	Hybrid of <i>Salvelinus namaycush</i> (Walbaum) and <i>Salvelinus fontinalis</i> (Mitchill)
Cisco, Lake Herring, Tuillibee	Cisco de lac	<i>Coregonus artedii</i> (Lesueur)
Bloater, Hoy's Cisco	Cisco de fumage	<i>Coregonus hoyi</i> (Gill)

1. The names of fish are as contained in "Freshwater Fishes of Canada" by W.B. Scott and E.J. Crossman, Bulletin 184, Fisheries Research Board of Canada, 1973.

1. Les noms de poissons sont suivant "Freshwater Fishes of Canada" par W.B. Scott et E.J. Crossman, Bulletin 184 de l'Office des recherches sur les pêcheries du Canada, 1973.

English Common Name	Nom français	Scientific Name Nom scientifique
Whitefish, Lake Whitefish	Grande corégone	<i>Coregonus clupeaformis</i> (Mitchill)
Round Whitefish, Menominee	Ménomini rond	<i>Prosopium cylindraceum</i> (Pallas)
Rainbow Smelt, Smelt	Éperlan arc-en-ciel, Éperlan du nord	<i>Osmerus mordax</i> (Mitchill)
Goldeye, Winnipeg Goldeye	Laquaiche aux yeux d'or	<i>Hiodon alosoides</i> (Rafinesque)
Moonéye	Laquaiche argentée	<i>Hiodon tergisus</i> (Lesueur)
Northern Pike, Pike, Great Northern Pike, Jack	Brochet, grand brochet	<i>Esox lucius</i> (Linnaeus)
Muskie, Muskellunge, Maskinonge, Lunge	Maskinongé	<i>Esox masquinongy</i> (Mitchill)
Goldfish Golden Carp	Poisson doré	<i>Carassius auratus</i> (Linnaeus)
Carp, Mirror Carp	Carpe	<i>Cyprinus carpio</i> (Linnaeus)
Quillback Carpsucker, Quillback, Drum	Couette	<i>Carpoides cyprinus</i> (Lesueur)
Longnose Sucker	Meunier rouge	<i>Catostomus catostomus</i> (Forster)
White Sucker, Common Sucker	Meunier noir	<i>Catostomus commersoni</i> (Lacépède)
Redhorse Sucker, Northern Redhorse, Common Mullet	Suceur rouge	<i>Moxostoma macrolepidotum</i> (Lesueur)
Emerald Shiner, Lake Shiner	Méné émeraude	<i>Notropis atherinoides</i> (Rafinesque)
Spottail Shiner, Shiner	Queue à tache noire	<i>Notropis hudsonius</i> (Clinton)
Brown Bullhead, Common	Barbotte brune	<i>Ictalurus nebulosus</i> (Lesueur)
Channel Catfish, Channel Cat	Barbue de rivière	<i>Ictalurus punctatus</i> (Rafinesque)
American Eel, Eel, Common Eel	Anguille d'Amérique	<i>Anguilla rostrata</i> (Lesueur)

English Common Name	Nom français	Scientific Name Nom scientifique
Burbot, Ling, Maria, Freshwater Cod, Lawyer	Lotte	<i>Lota lota</i> (Linnaeus)
White Perch, Silver Perch	Bar-perche	<i>Morone americana</i> (Gmelin)
White Bass, Silver Bass	Bar blanc	<i>Morone chrysops</i> (Rafinesque)
Rock Bass, Redeye	Crapet de roche	<i>Ambloplites rupestris</i> (Rafinesque)
Pumpkinseed, Common Sunfish	Crapet-soleil	<i>Lepomis gibbosus</i> (Linnaeus)
Bluegill, Bluegill Sunfish, Bream	Crapet arlequin	<i>Lepomis machrochirus</i> (Rafinesque)
Smallmouth Bass, Black Bass	Achigan à petite bouche	<i>Micropterus dolomieu</i> (Lacépède)
Largemouth Bass, Largemouth, Black Bass, Green Bass	Achigan à grande bouche	<i>Micropterus salmoides</i> (Lacépède)
White Crappie, Crappie	Marigane blanche	<i>Pomoxis annularis</i> (Rafinesque)
Black Crappie, Crappie, Calico Bass	Marigane noire	<i>Pomoxis nigromaculatis</i> (Lesueur)
Yellow Perch, Perch, Lake Perch	Perchaude	<i>Perca flavescens</i> (Mitchill)
Sauger, Sand Pickerel, Sand Pike	Doré noir	<i>Stizostedion canadense</i> (Smith)
Walleye, Yellow Walleye, Pickerel, Yellow Pickerel, Wall-eyed Pike, Pike-Perch	Doré	<i>Stizostedion vitreum</i> (Mitchill)
Freshwater Drum, Sheepshead, Drum	Malachigan	<i>Aplodinotus grunniens</i> (Rafinesque)

## Handling Your Catch

You have caught your fish and used this guide to determine its suitability for consumption. If you have decided to keep and eat your catch, you should try to keep it in the best possible condition until it reaches the table. Freshly caught fish should be chilled by placing on ice or under refrigeration as soon as possible. Then at the earliest opportunity, the fish should be cleaned, dressed, and refrigerated or preserved for future use. Fish are usually cleaned and dressed by slitting open the belly from the vent (anal opening) forward to the head and removing the viscera, gills, and kidneys (the dark red patch attached to the backbone). Scaling is usually done after cleaning. Trimming away of head and fins results in pan-ready or pan-dressed fish. To obtain fillets, which are the most convenient form for many recipes or freezer storage where space is at a premium, (and also the portion containing the lowest level of organic contaminants where they are a factor) use the following procedure:

Lay the fish on its side on a cutting board. With a sharp thin-bladed knife, cut through the skin and flesh just behind the head down to the backbone. Turn the knife blade along the backbone and with a sawing motion of the blade, follow the backbone down to the tail, keeping as close to the backbone as possible. Repeat for the fillet on the other side of the fish. Laying each fillet skin side down on the board, remove the rib bones by inserting the knife blade just under the ribs and separating them from the fillet with as little flesh left on them as possible. Trim away the pelvic fin and any belly fat from the ventral portion of the fillet. To remove the skin, lay the fillet skin side down and starting at the tail with the knife blade parallel to the skin and as close to it as possible, slice forward with a sawing motion to separate the skin from the fillet. You are then left with skinless, boneless fillets. Wash in clean cold water and cook, refrigerate, freeze or preserve as desired.

## Comment nettoyer le poisson

Une fois qu'on a attrapé un poisson et, qu'à l'aide du présent guide, on a confirmé qu'il est bien propre à la consommation, il faut le conserver dans le meilleur état possible jusqu'à ce qu'il soit prêt à être consommé. On doit mettre un poisson fraîchement pêché sur la glace ou le réfrigérer dans les plus brefs délais. Ensuite, il faut le nettoyer, le vider, le réfrigérer ou le traiter le plus tôt possible. D'habitude, on vide le poisson en fendant la paroi ventrale de la fente anale jusqu'à la tête et en retirant les viscères, les ouïes et les reins (organes rouge foncé fixés à l'arête centrale). Une fois qu'on a vidé le poisson, on l'écaille. Quand on a retranché la tête et coupé les nageoires, on obtient du poisson prêt pour la friture. Il est souvent pratique de lever les filets du poisson pour de nombreuses recettes ou pour le conserver au congélateur, où l'espace est souvent restreint. En outre, le filet est la partie du poisson qui contient le plus faible niveau de contaminants organiques. Voici comment il faut procéder pour obtenir un filet:

Poser le poisson à plat sur la planche à découper. À l'aide d'un couteau bien aiguisé à lame fine, trancher la peau et la chair qui se trouvent derrière la tête jusqu'à l'arête centrale. Puis, fendre le poisson tout au long du dos en glissant le couteau le long de l'arête centrale jusqu'à la queue. Détacher l'autre côté de la même manière. Pour enlever les arêtes, poser le filet sur la planche, le côté peau dessous. En insérant la lame sous les arêtes, les détacher du filet en y laissant le moins de chair possible. Retrancher ensuite la nageoire abdominale ainsi que tout gras de la partie ventrale du filet. Pour en retirer la peau, poser le filet sur la planche, le côté peau dessous, et, avec le couteau bien à plat, commencer à le glisser entre la peau et la chair, de la queue à la tête, en remontant par petites saccades. On obtient ainsi un filet sans peau ni arêtes. Laver ensuite à grande eau très froide et faire cuire, réfrigérer, congeler ou mariner.

## How To Release Fish

If you decide not to keep a particular fish, here are some tips to remember when returning fish to the water.

(1) Time is essential. Quickly play and release fish. A fish played for too long will be too exhausted to recover.

(2) Keep the fish in the water as much as possible. Out of water it will suffocate. Don't allow it to flop on the beach or on rocks. Just a few inches of water under a thrashing fish acts as a protective cushion.

(3) Gentle handling is essential. Don't put your fingers in the gills. Do not squeeze small fish; lift them by the lower lip. A net is helpful but keep it in the water.

(4) Remove hooks quickly with longnosed pliers. If deeply hooked, cut the line and leave the hook in. Do not tear out hooks; they will dissolve and not harm the fish.

(5) To revive an unconscious fish, hold it upright in the water heading upstream (if there is a current). Apply artificial respiration by moving fish forward and backward so that water runs through the gills. This may take a few minutes. When the fish begins to struggle, release it.

## Comment relâcher le poisson

Si on décide de relâcher le poisson, on doit garder présents à l'esprit les facteurs suivants:

1) Il faut d'abord tenir compte du facteur temps. Fatiguez le poisson le moins longtemps possible, car un poisson trop fatigué est trop épuisé pour se remettre.

2) Dans la mesure du possible, laissez le poisson dans l'eau: hors de l'eau, le poisson suffoque. Évitez également de la laisser échouer sur la grève ou sur le roc: quelques centimètres d'eau suffisent à protéger un poisson qui se débat.

3) Il faut manier le poisson avec douceur. Évitez de lui mettre des doigts dans les ouïes. Au lieu de serrer les petits poissons, les tenir par la lèvre inférieure. Un filet de pêche est utile, mais seulement quand on le laisse dans l'eau.

4) Il faut enlever le plus tôt possible l'hameçon à l'aide de pinces à long bec. S'il est fixé profondément dans la gueule du poisson, on doit l'y laisser et couper la ligne à pêche. Il n'est pas nécessaire d'arracher l'hameçon, car celui-ci se dissout à la longue et ne fera pas de mal au poisson.

5) Pour ranimer un poisson qui s'est évanoui, le tenir dans l'eau verticalement et en allant contre le courant (s'il y a lieu). Pratiquer la respiration artificielle en le poussant à tour de rôle vers l'avant et vers l'arrière, de façon à ce que l'eau lui pénètre dans les ouïes (ce qui peut prendre quelques minutes). Quand il commence à se débattre, il est prêt à être relâché.

## Parasites of Fish

Occasionally, anglers may catch fish which contain worms, grubs, cysts, or nodules in the flesh. When cleaning fish they may observe worms in or around the intestines of the fish or notice fungus growths on the skin, fins or gills. These parasites of fish are a normal occurrence and form an integral part of the ecosystem in which the fish lives. While not aesthetically pleasing, parasites in the edible portions of fish will be destroyed by thorough cooking of the flesh.

Some of the most commonly seen parasites in fish are Black Spot in bass and yellow perch, leeches, fish lice, gill flukes, Yellow Grubs (in the flesh), *Gluglea* (a protozoan in smelt), and, of course, the Lamprey.

## Tumours in Fish

Anglers may also catch fish which exhibit external or internal growths or tumours. Such growths or lesions are technically called neoplasms and certain kinds of them have been known in Ontario fish as long ago as 1909. Lymphosarcoma in Northern Pike and Muskellunge appears as blotchy red sores usually on the posterior end of the fish. It is commonly seen only in the spring and fall. Skin tumours of various types also occur in walleye in Canada. Tumours or papilloma are found on white suckers and brown bullhead. Often these growths are most common on the lips of the fish. The causal agent for most of these conditions is not known; in some cases viruses have been implicated.

## Parasites des poissons

Il arrive parfois qu'un pêcheur à la ligne prenne un poisson qui est infesté de vers ou de larves ou qui a des kystes ou nodules dans la chair. En nettoyant le poisson, le pêcheur peut découvrir des vers dans les intestins ou près de ceux-ci, ainsi que de la moisissure sur la peau, les nageoires ou les ouïes. La présence de ces parasites est tout à fait normale, car ils font partie de l'écosystème dans lequel évoluent les poissons. Même si leur apparence laisse beaucoup à désirer, on détruit les parasites qui se trouvent dans la partie comestible du poisson en la cuisant à fond.

Parmi les parasites les plus répandus dans les poissons, mentionnons: les taches noires chez les achigans et les perchaudes, les sangsues, les poux de poissons, les doutes des ouïes, les larves jaunes (dans la chair), les *Gluglea* (protozoaires dans les éperlans) et, bien sûr, les lamproies.

## Tumeurs chez les poissons

Les pêcheurs à la ligne peuvent aussi prendre des poissons qui comportent des excroissances ou tumeurs externes ou internes. Celles-ci sont connues sous le nom technique de "néoplasmes": on en a constaté la présence dès 1909 chez les poissons de l'Ontario. Les lymphosarcomes dans le brochet et le maskinongé se présentent sous forme de plaies tachetées de couleur rouge, qui se trouvent habituellement dans la partie postérieure du poisson. Elles apparaissent seulement au printemps et à l'automne. Les dorés du Canada sont également atteints de divers types de tumeurs à la peau. Des meuniers noirs et des barbottes brunes ont présenté des tumeurs ou papillomes. Ces excroissances se trouvent habituellement sur les lèvres des poissons. On n'a pas encore réussi à découvrir la cause de ces phénomènes: certains d'entre eux ont été attribués à des virus.

## For Further Information

Readers requiring further information regarding this publication and program, and contaminants in fish or other parts of the aquatic environment should contact the Aquatic Contaminants Section, Water Resources Branch, Ontario Ministry of the Environment, 135 St. Clair Ave., W., Toronto, Ontario, M4V 1P5  
Telephone 1 (416) 965-6954.

To report instances of pollution or fish kills contact the nearest office of the Ministry of the Environment listed at the back of this book.

Those requiring information on angling regulations, limits of catch, open seasons, etc, should obtain a copy of the "Fishing Regulations", available from any office of the Ministry of Natural Resources listed at the back of this book. Fishing maps of surveyed lakes are also available from these offices for a nominal charge.

## Pour obtenir des plus amples renseignements

Tous lecteurs qui désirent obtenir de plus amples renseignements au sujet de la présente publication et du programme, ainsi que des contaminants dans les poissons ou les autres éléments du milieu aquatique, doit s'adresser à section des contaminants aquatiques, Direction des ressources en eau, Ministère de l'Environnement de l'Ontario, 135 ouest, avenue St. Clair, Toronto, Ontario, M4V 1P5.  
Telephone: (416) 965-6954.

Pour signaler des cas de pollution ou d'empoisonnement de poissons, s'adresser au bureau le plus proche du ministère de l'Environnement énuméré à la fin de la présente publication.

Ceux qui ont besoin de renseignements sur le règlement de la pêche à la ligne, les limites de la pêche, la saison de la pêche, etc. doivent se procurer un *Résumé des règlements de la pêche* disponible dans tous les bureaux du ministère des Richesses naturelles énumérés à la fin de la présente publication. En outre, ces bureaux offrent, à prix minime, des cartes pour la pêche des lacs pour lesquels on a fait des levés topographiques.
